Actor-Critic Algorithms

CS 285

Instructor: Sergey Levine

UC Berkeley

Recap: policy gradients

REINFORCE algorithm:

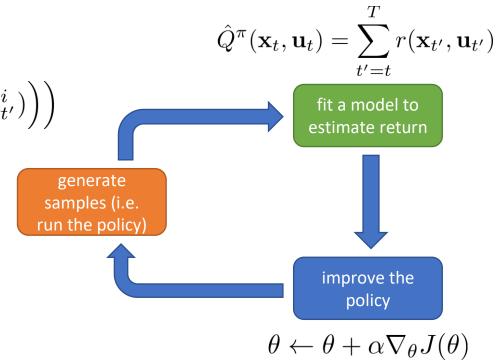

1. sample $\{\tau^i\}$ from $\pi_{\theta}(\mathbf{a}_t|\mathbf{s}_t)$ (run the policy)

2.
$$\nabla_{\theta} J(\theta) \approx \sum_{i} \left(\sum_{t=1}^{T} \nabla_{\theta} \log \pi_{\theta}(\mathbf{a}_{t}^{i} | \mathbf{s}_{t}^{i}) \left(\sum_{t'=t}^{T} r(\mathbf{s}_{t'}^{i}, \mathbf{a}_{t'}^{i}) \right) \right)$$

3.
$$\theta \leftarrow \theta + \alpha \nabla_{\theta} J(\theta)$$

$$\nabla_{\theta} J(\theta) \approx \frac{1}{N} \sum_{i=1}^{N} \sum_{t=1}^{T} \nabla_{\theta} \log \pi_{\theta}(\mathbf{a}_{i,t} | \mathbf{s}_{i,t}) \hat{Q}_{i,t}^{\pi}$$

"reward to go"

Improving the policy gradient

$$\nabla_{\theta} J(\theta) \approx \frac{1}{N} \sum_{i=1}^{N} \sum_{t=1}^{T} \nabla_{\theta} \log \pi_{\theta}(\mathbf{a}_{i,t} | \mathbf{s}_{i,t}) \left(\sum_{t'=1}^{T} r(\mathbf{s}_{i,t'}, \mathbf{a}_{i,t'}) \right)$$

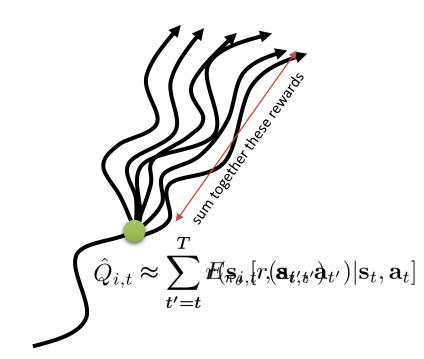

"reward to go"

 $\hat{Q}_{i,t}$

 $\hat{Q}_{i,t}$: estimate of expected reward if we take action $\mathbf{a}_{i,t}$ in state $\mathbf{s}_{i,t}$ can we get a better estimate?

$$Q(\mathbf{s}_t, \mathbf{a}_t) = \sum_{t'=t}^T E_{\pi_{\theta}} [r(\mathbf{s}_{t'}, \mathbf{a}_{t'}) | \mathbf{s}_t, \mathbf{a}_t]$$
: true expected reward-to-go

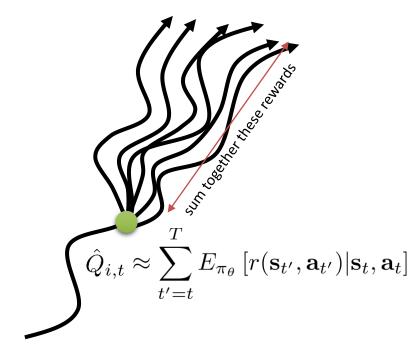

$$\nabla_{\theta} J(\theta) \approx \frac{1}{N} \sum_{i=1}^{N} \sum_{t=1}^{T} \nabla_{\theta} \log \pi_{\theta}(\mathbf{a}_{i,t} | \mathbf{s}_{i,t}) Q(\mathbf{s}_{i,t}, \mathbf{a}_{i,t})$$

What about the baseline?

$$\begin{split} Q(\mathbf{s}_{t}, \mathbf{a}_{t}) &= \sum_{t'=t}^{T} E_{\pi_{\theta}} \left[r(\mathbf{s}_{t'}, \mathbf{a}_{t'}) | \mathbf{s}_{t}, \mathbf{a}_{t} \right] : \text{ true } \textit{expected } \text{ reward-to-go} \\ \nabla_{\theta} J(\theta) &\approx \frac{1}{N} \sum_{i=1}^{N} \sum_{t=1}^{T} \nabla_{\theta} \log \pi_{\theta}(\mathbf{a}_{i,t} | \mathbf{s}_{i,t}) \text{ (Some sum of } \mathbf{s}_{i,t}) - \text{W}(\mathbf{s}_{i,t}) \\ b_{t} &= \sum_{i}^{N} \sum_{t=1}^{N} \sum_{t=1}^{T} \nabla_{\theta} \log \pi_{\theta}(\mathbf{a}_{i,t} | \mathbf{s}_{i,t}) \text{ average what?} \end{split}$$

$$V(\mathbf{s}_{t}) = E_{\mathbf{a}_{t} \sim \pi_{\theta}(\mathbf{a}_{t} | \mathbf{s}_{t})} [Q(\mathbf{s}_{t}, \mathbf{a}_{t})]$$

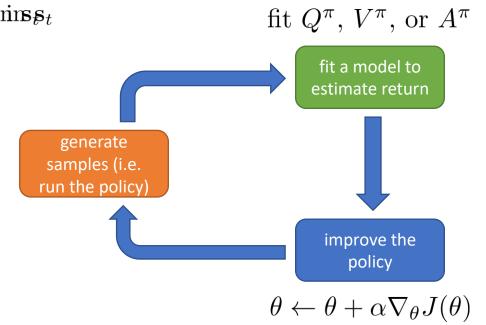

State & state-action value functions

$$Q(s_{t}, a_{t}) = \sum_{t' \neq t}^{TT} F_{t'} \left[r[(s_{t'}, a_{t'}, a_{t'}) | s_{t'}, a_{t'}] : total reward from takking a a in s_t \right]$$

$$V^{\pi}(\mathbf{s}_t) = E_{\mathbf{a}_t \sim \pi_{\theta}(\mathbf{a}_t | \mathbf{s}_t)}[Q^{\pi}(\mathbf{s}_t, \mathbf{a}_t)]$$
: total reward from \mathbf{s}_t

$$A^{\pi}(\mathbf{s}_t, \mathbf{a}_t) = Q^{\pi}(\mathbf{s}_t, \mathbf{a}_t) - V^{\pi}(\mathbf{s}_t)$$
: how much better \mathbf{a}_t is

$$\nabla_{\theta} J(\theta) \approx \frac{1}{N} \sum_{i=1}^{N} \sum_{t=1}^{T} \nabla_{\theta} \log \pi_{\theta}(\mathbf{a}_{i,t} | \mathbf{s}_{i,t}) A^{\pi}(\mathbf{s}_{i,t}, \mathbf{a}_{i,t})$$

the better this estimate, the lower the variance

$$\nabla_{\theta} J(\theta) \approx \frac{1}{N} \sum_{i=1}^{N} \sum_{t=1}^{T} \nabla_{\theta} \log \pi_{\theta}(\mathbf{a}_{i,t} | \mathbf{s}_{i,t}) \left(\sum_{t'=1}^{T} r(\mathbf{s}_{i,t'}, \mathbf{a}_{i,t'}) - b \right)$$

unbiased, but high variance single-sample estimate

Value function fitting

$$Q^{\pi}(\mathbf{s}_t, \mathbf{a}_t) = \sum_{t'=t}^{T} E_{\pi_{\theta}} \left[r(\mathbf{s}_{t'}, \mathbf{a}_{t'}) | \mathbf{s}_t, \mathbf{a}_t \right]$$

$$V^{\pi}(\mathbf{s}_t) = E_{\mathbf{a}_t \sim \pi_{\theta}(\mathbf{a}_t | \mathbf{s}_t)}[Q^{\pi}(\mathbf{s}_t, \mathbf{a}_t)]$$

$$A^{\pi}(\mathbf{s}_t, \mathbf{a}_t) = Q^{\pi}(\mathbf{s}_t, \mathbf{a}_t) - V^{\pi}(\mathbf{s}_t)$$

$$\nabla_{\theta} J(\theta) \approx \frac{1}{N} \sum_{i=1}^{N} \sum_{t=1}^{T} \nabla_{\theta} \log \pi_{\theta}(\mathbf{a}_{i,t}|\mathbf{s}_{i,t}) A^{\pi}(\mathbf{s}_{i,t},\mathbf{a}_{i,t})$$

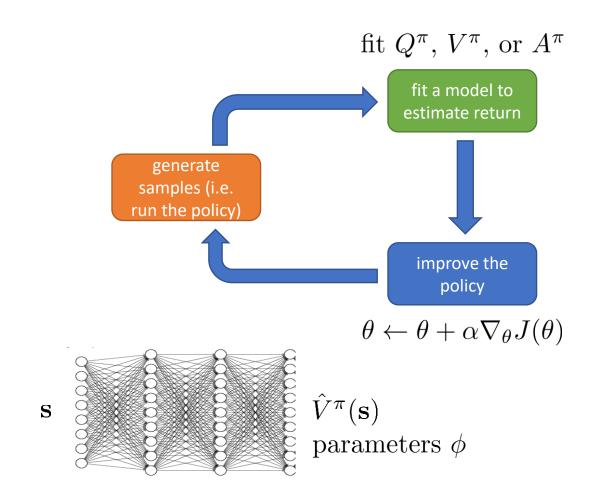

fit what to what?

$$Q^{\pi}, V^{\pi}, A^{\pi}$$
?

$$Q^{\pi}(\mathbf{s}_{t}, \mathbf{a}_{t}) \approx \sum_{t=1}^{T} \mathbf{a}_{t} \sum_{t=1}^{T} \mathbf{a}_{t}$$

$$A^{\pi}(\mathbf{s}_t, \mathbf{a}_t) \approx r(\mathbf{s}_t, \mathbf{a}_t) + V^{\pi}(\mathbf{s}_{t+1}) \stackrel{V^{\pi}(\mathbf{s}_t)}{\sim} t_t$$

let's just fit $V^{\pi}(\mathbf{s})!$

Policy evaluation

$$V^{\pi}(\mathbf{s}_t) = \sum_{t'=t}^{T} E_{\pi_{\theta}} \left[r(\mathbf{s}_{t'}, \mathbf{a}_{t'}) | \mathbf{s}_t \right]$$

$$J(\theta) = E_{\mathbf{s}_1 \sim p(\mathbf{s}_1)}[V^{\pi}(\mathbf{s}_1)]$$

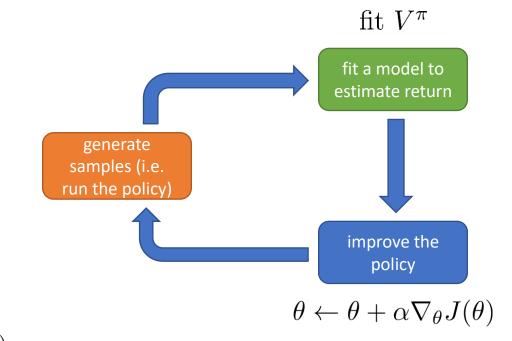

how can we perform policy evaluation?

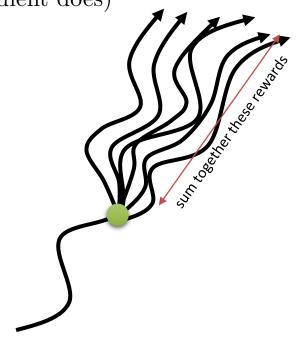

Monte Carlo policy evaluation (this is what policy gradient does)

$$V^{\pi}(\mathbf{s}_t) \approx \sum_{t'=t}^{T} r(\mathbf{s}_{t'}, \mathbf{a}_{t'})$$

$$V^{\pi}(\mathbf{s}_t) pprox \frac{1}{N} \sum_{i=1}^{N} \sum_{t'=t}^{T} r(\mathbf{s}_{t'}, \mathbf{a}_{t'})$$

(requires us to reset the simulator)

Monte Carlo evaluation with function approximation

$$V^{\pi}(\mathbf{s}_t) pprox \sum_{t'=t}^{T} r(\mathbf{s}_{t'}, \mathbf{a}_{t'})$$

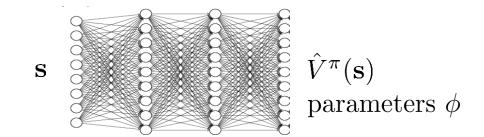

not as good as this: $V^{\pi}(\mathbf{s}_t) \approx \frac{1}{N} \sum_{i=1}^{N} \sum_{t'=t}^{T} r(\mathbf{s}_{t'}, \mathbf{a}_{t'})$

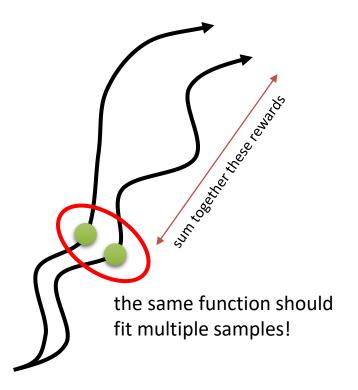

but still pretty good!

training data:
$$\left\{ \left(\mathbf{s}_{i,t}, \sum_{t'=t}^{T} r(\mathbf{s}_{i,t'}, \mathbf{a}_{i,t'}) \right) \right\}$$

$$y_{i,t}$$

supervised regression:
$$\mathcal{L}(\phi) = \frac{1}{2} \sum_{i} \left\| \hat{V}_{\phi}^{\pi}(\mathbf{s}_{i}) - y_{i} \right\|^{2}$$

Can we do better?

ideal target:
$$y_{i,t} = \sum_{t'=t}^{T} E_{\pi_{\theta}} \left[r(\mathbf{s}_{t'}, \mathbf{a}_{t'}) | \mathbf{s}_{i,t} \right] \approx r(\mathbf{s}_{i,t}, \mathbf{a}_{i,t}) + \sum_{t}^{T} \left(\underline{\mathbf{s}}_{i,t+1} \mathbf{b}_{\pi_{\theta}} \right) \left[r(\mathbf{s}_{i',t}, \mathbf{a}_{i'}) | \mathbf{s}_{i,t+1} \mathbf{b}_{\pi_{\theta}} \right] r(\mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}}) \left[r(\mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}}) | \mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}} \right] r(\mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}}) \left[r(\mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}}) | \mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}} \right] r(\mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}}) \left[r(\mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}}) | \mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}} \right] r(\mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}}) \left[r(\mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}}) | \mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}} \right] r(\mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}}) \left[r(\mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}}) | \mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}} \right] r(\mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}}) \left[r(\mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}}) | \mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}} \right] r(\mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}}) \left[r(\mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}}) | \mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}} \right] r(\mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}}) \left[r(\mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}}) | \mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}} \right] r(\mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}}) \left[r(\mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}}) | \mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}} \right] r(\mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}}) \left[r(\mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}}) | \mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}} \right] r(\mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}}) \left[r(\mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}}) | \mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}} \right] r(\mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}}) \left[r(\mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}}) | \mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}} \right] r(\mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}}) \left[r(\mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}}) | \mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}} \right] r(\mathbf{s}_{i',t+1} \mathbf{b}_{\pi_{\theta}}) r(\mathbf{s}_{i',t+1$$

Monte Carlo target: $y_{i,t} = \sum_{t'=t}^{T} r(\mathbf{s}_{i,t'}, \mathbf{a}_{i,t'})$

directly use previous fitted value function!

training data:
$$\left\{ \left(\mathbf{s}_{i,t}, r(\mathbf{s}_{i,t}, \mathbf{a}_{i,t}) + \hat{V}_{\phi}^{\pi}(\mathbf{s}_{i,t+1}) \right) \right\}$$

$$y_{i,t}$$

supervised regression:
$$\mathcal{L}(\phi) = \frac{1}{2} \sum_{i} \left\| \hat{V}_{\phi}^{\pi}(\mathbf{s}_{i}) - y_{i} \right\|^{2}$$

sometimes referred to as a "bootstrapped" estimate

Policy evaluation examples

TD-Gammon, Gerald Tesauro 1992

AlphaGo, Silver et al. 2016

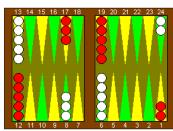

Figure 2. An illustration of the normal opening position in backgammon. TD-Gammon has sparked a near-universal conversion in the way experts play certain opening rolls. For example, with an opening roll of 4-1, most players have now switched from the traditional move of 13-9, 6-5, to TD-Gammon's preference, 13-9, 24-23. TD-Gammon's analysis is given in Table 2.

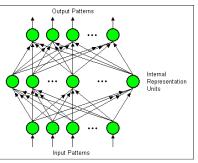

Figure 1. An illustration of the multilayer perception architecture used in TD-Gammon's neural network. This architecture is also used in the popular backpropagation learning procedure. Figure reproduced from [9].

reward: game outcome

value function $\hat{V}_{\phi}^{\pi}(\mathbf{s}_t)$:

expected outcome given board state

reward: game outcome

value function $\hat{V}_{\phi}^{\pi}(\mathbf{s}_t)$:

expected outcome given board state

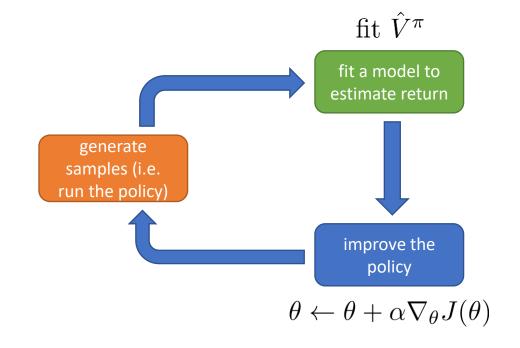

From Evaluation to Actor Critic

An actor-critic algorithm

batch actor-critic algorithm:

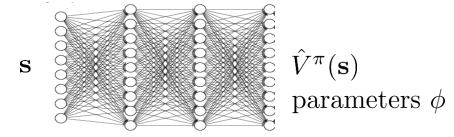

- 2. fit $\hat{V}_{\phi}^{\pi}(\mathbf{s})$ to sampled reward sums
- 3. $\overline{\text{evaluate } \hat{A}^{\pi}(\mathbf{s}_i, \mathbf{a}_i) = r(\mathbf{s}_i, \mathbf{a}_i) + \hat{V}_{\phi}^{\pi}(\mathbf{s}_i') \hat{V}_{\phi}^{\pi}(\mathbf{s}_i)}$
- 4. $\nabla_{\theta} J(\theta) \approx \sum_{i} \nabla_{\theta} \log \pi_{\theta}(\mathbf{a}_{i}|\mathbf{s}_{i}) \hat{A}^{\pi}(\mathbf{s}_{i},\mathbf{a}_{i})$
- 5. $\theta \leftarrow \theta + \alpha \nabla_{\theta} J(\theta)$

$$V^{\pi}(\mathbf{s}\mathbf{y}_{t}) \approx \sum_{t=1}^{T} \mathbf{z}(\mathbf{s}_{t}) [\mathbf{t}, (\hat{\mathbf{x}}_{t})^{\pi}(\hat{\mathbf{s}}_{t}), \mathbf{t})]$$

$$\mathcal{L}(\phi) = \frac{1}{2} \sum_{i} \left\| \hat{V}_{\phi}^{\pi}(\mathbf{s}_{i}) - y_{i} \right\|^{2}$$

$$V^{\pi}(\mathbf{s}_t) = \sum_{t'=t}^{T} E_{\pi_{\theta}} \left[r(\mathbf{s}_{t'}, \mathbf{a}_{t'}) | \mathbf{s}_t \right]$$

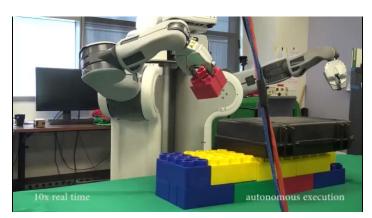

Aside: discount factors

$$y_{i,t} \approx r(\mathbf{s}_{i,t}, \mathbf{a}_{i,t}) + \hat{V}_{\phi}^{\pi}(\mathbf{s}_{i,t+1})$$

$$\mathcal{L}(\phi) = \frac{1}{2} \sum_{i} \left\| \hat{V}_{\phi}^{\pi}(\mathbf{s}_{i}) - y_{i} \right\|^{2}$$

what if T (episode length) is ∞ ?

 \hat{V}_{ϕ}^{π} can get infinitely large in many cases

episodic tasks

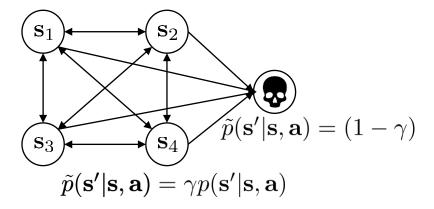

continuous/cyclical tasks

simple trick: better to get rewards sooner than later

$$y_{i,t} \approx r(\mathbf{s}_{i,t}, \mathbf{a}_{i,t}) + \gamma \hat{V}_{\phi}^{\pi}(\mathbf{s}_{i,t+1})$$
discount factor $\gamma \in [0, 1]$ (0.99 works well)

 γ changes the MDP:

Aside: discount factors for policy gradients

$$y_{i,t} \approx r(\mathbf{s}_{i,t}, \mathbf{a}_{i,t}) + \gamma \hat{V}_{\phi}^{\pi}(\mathbf{s}_{i,t+1})$$

$$\mathcal{L}(\phi) = \frac{1}{2} \sum_{i} \left\| \hat{V}_{\phi}^{\pi}(\mathbf{s}_{i}) - y_{i} \right\|^{2}$$

$$\forall \mathbf{v}_{\theta}^{\pi}(\mathbf{s}_{i,t}, \mathbf{a}_{i,t})$$

$$\nabla_{\theta} J(\theta) \approx \frac{1}{N} \sum_{i=1}^{N} \sum_{t=1}^{T} \nabla_{\theta} \log \pi_{\theta}(\mathbf{a}_{i,t}|\mathbf{s}_{i,t}) \left(r(\mathbf{s}_{i,t}, \mathbf{a}_{i,t}) + \gamma \hat{V}_{\phi}^{\pi}(\mathbf{s}_{i,t+1}) - \hat{V}_{\phi}^{\pi}(\mathbf{s}_{i,t}) \right)$$

what about (Monte Carlo) policy gradients?

option 1:
$$\nabla_{\theta} J(\theta) \approx \frac{1}{N} \sum_{i=1}^{N} \sum_{t=1}^{T} \nabla_{\theta} \log \pi_{\theta}(\mathbf{a}_{i,t} | \mathbf{s}_{i,t}) \left(\sum_{t'=t}^{T} \gamma^{t'-t} r(\mathbf{s}_{i,t'}, \mathbf{a}_{i,t'}) \right)$$
option 2:
$$\nabla_{\theta} J(\theta) \approx \frac{1}{N} \sum_{i=1}^{N} \left(\sum_{t=1}^{T} \nabla_{\theta} \log \pi_{\theta}(\mathbf{a}_{i,t} | \mathbf{s}_{i,t}) \right) \left(\sum_{t=1}^{T} \gamma^{t-1} r(\mathbf{s}_{i,t'}, \mathbf{a}_{i,t'}) \right)$$

$$\nabla_{\theta} J(\theta) \approx \frac{1}{N} \sum_{i=1}^{N} \sum_{t=1}^{T} \nabla_{\theta} \log \pi_{\theta}(\mathbf{a}_{i,t} | \mathbf{s}_{i,t}) \left(\sum_{t'=t}^{T} \gamma^{t'} \mathbf{1} (\mathbf{s}_{i,t'}, \mathbf{a}_{i,t'}) \right)$$

$$\nabla_{\theta} J(\theta) \approx \frac{1}{N} \sum_{i=1}^{N} \sum_{t=1}^{T} \gamma^{t-1} \nabla_{\theta} \log \pi_{\theta}(\mathbf{a}_{i,t} | \mathbf{s}_{i,t}) \left(\sum_{t'=t}^{T} \gamma^{t'-t} r(\mathbf{s}_{i,t'}, \mathbf{a}_{i,t'}) \right)$$
(later steps matter less)

Which version is the right one?

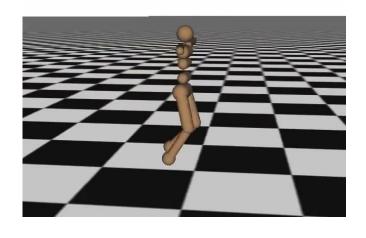

option 1:
$$\nabla_{\theta} J(\theta) \approx \frac{1}{N} \sum_{i=1}^{N} \sum_{t=1}^{T} \nabla_{\theta} \log \pi_{\theta}(\mathbf{a}_{i,t} | \mathbf{s}_{i,t}) \left(\sum_{t'=t}^{T} \gamma^{t'-t} r(\mathbf{s}_{i,t'}, \mathbf{a}_{i,t'}) \right)$$

option 2:
$$\nabla_{\theta} J(\theta) \approx \frac{1}{N} \sum_{i=1}^{N} \sum_{t=1}^{T} \gamma^{t-1} \nabla_{\theta} \log \pi_{\theta}(\mathbf{a}_{i,t} | \mathbf{s}_{i,t}) \left(\sum_{t'=t}^{T} \gamma^{t'-t} r(\mathbf{s}_{i,t'}, \mathbf{a}_{i,t'}) \right)$$

later steps don't matter if you're dead!

this is what we actually use... why?

Iteration 2000

 $\tilde{p}(\mathbf{s'}|\mathbf{s}, \mathbf{a}) = \gamma p(\mathbf{s'}|\mathbf{s}, \mathbf{a})$

 $\widetilde{p}(\mathbf{s}'|\mathbf{s}, \mathbf{a}) = (1 - \gamma)$

Actor-critic algorithms (with discount)

batch actor-critic algorithm:

- \rightarrow 1
- 1. sample $\{\mathbf{s}_i, \mathbf{a}_i\}$ from $\pi_{\theta}(\mathbf{a}|\mathbf{s})$ (run it on the robot)
 - 2. fit $\hat{V}_{\phi}^{\pi}(\mathbf{s})$ to sampled reward sums
 - 3. evaluate $\hat{A}^{\pi}(\mathbf{s}_i, \mathbf{a}_i) = r(\mathbf{s}_i, \mathbf{a}_i) + \gamma \hat{V}_{\phi}^{\pi}(\mathbf{s}_i') \hat{V}_{\phi}^{\pi}(\mathbf{s}_i)$
 - 4. $\nabla_{\theta} J(\theta) \approx \sum_{i} \nabla_{\theta} \log \pi_{\theta}(\mathbf{a}_{i}|\mathbf{s}_{i}) \hat{A}^{\pi}(\mathbf{s}_{i},\mathbf{a}_{i})$
 - 5. $\theta \leftarrow \theta + \alpha \nabla_{\theta} J(\theta)$

online actor-critic algorithm:

- 1. tal
 - 1. take action $\mathbf{a} \sim \pi_{\theta}(\mathbf{a}|\mathbf{s})$, get $(\mathbf{s}, \mathbf{a}, \mathbf{s}', r)$
 - 2. update \hat{V}_{ϕ}^{π} using target $r + \gamma \hat{V}_{\phi}^{\pi}(\mathbf{s}')$
 - 3. evaluate $\hat{A}^{\pi}(\mathbf{s}, \mathbf{a}) = r(\mathbf{s}, \mathbf{a}) + \gamma \hat{V}_{\phi}^{\pi}(\mathbf{s}') \hat{V}_{\phi}^{\pi}(\mathbf{s})$
 - 4. $\nabla_{\theta} J(\theta) \approx \nabla_{\theta} \log \pi_{\theta}(\mathbf{a}|\mathbf{s}) \hat{A}^{\pi}(\mathbf{s},\mathbf{a})$
 - 5. $\theta \leftarrow \theta + \alpha \nabla_{\theta} J(\theta)$

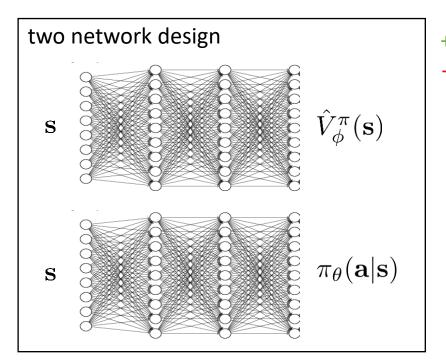

Actor-Critic Design Decisions

Architecture design

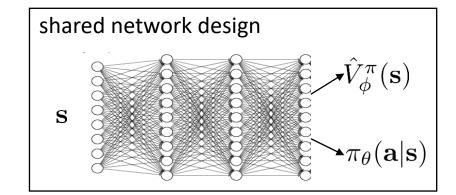

online actor-critic algorithm:

- 1. take action $\mathbf{a} \sim \pi_{\theta}(\mathbf{a}|\mathbf{s})$, get $(\mathbf{s}, \mathbf{a}, \mathbf{s}', r)$
- 2. update \hat{V}_{ϕ}^{π} using target $r + \gamma \hat{V}_{\phi}^{\pi}(\mathbf{s}')$ 3. evaluate $\hat{A}^{\pi}(\mathbf{s}, \mathbf{a}) = r(\mathbf{s}, \mathbf{a}) + \gamma \hat{V}_{\phi}^{\pi}(\mathbf{s}') \hat{V}_{\phi}^{\pi}(\mathbf{s})$
- 4. $\nabla_{\theta} J(\theta) \approx \nabla_{\theta} \log \pi_{\theta}(\mathbf{a}|\mathbf{s}) \hat{A}^{\pi}(\mathbf{s},\mathbf{a})$
- 5. $\theta \leftarrow \theta + \alpha \nabla_{\theta} J(\theta)$

- + simple & stable
- no shared features between actor & critic

Online actor-critic in practice

online actor-critic algorithm:

- 1. take action $\mathbf{a} \sim \pi_{\theta}(\mathbf{a}|\mathbf{s})$, get $(\mathbf{s}, \mathbf{a}, \mathbf{s}', r)$
- 2. update \hat{V}_{ϕ}^{π} using target $r + \gamma \hat{V}_{\phi}^{\pi}(\mathbf{s}')$ works best with a batch (e.g., parallel workers)

 3. evaluate $\hat{A}^{\pi}(\mathbf{s}, \mathbf{a}) = r(\mathbf{s}, \mathbf{a}) + \gamma \hat{V}_{\phi}^{\pi}(\mathbf{s}') \hat{V}_{\phi}^{\pi}(\mathbf{s})$ 4. $\nabla_{\theta} J(\theta) \approx \nabla_{\theta} \log \pi_{\theta}(\mathbf{a}|\mathbf{s}) \hat{A}^{\pi}(\mathbf{s}, \mathbf{a})$

 - 5. $\theta \leftarrow \theta + \alpha \nabla_{\theta} J(\theta)$

synchronized parallel actor-critic

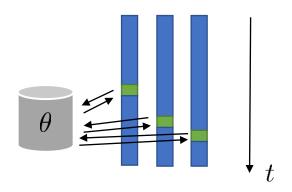

get
$$(\mathbf{s}, \mathbf{a}, \mathbf{s}', r) \leftarrow$$

update $\theta \leftarrow$

get $(\mathbf{s}, \mathbf{a}, \mathbf{s}', r) \leftarrow$

update $\theta \leftarrow$

asynchronous parallel actor-critic

Critics as Baselines

Critics as state-dependent baselines

Actor-critic:
$$\nabla_{\theta} J(\theta) \approx \frac{1}{N} \sum_{i=1}^{N} \sum_{t=1}^{T} \nabla_{\theta} \log \pi_{\theta}(\mathbf{a}_{i,t}|\mathbf{s}_{i,t}) \left(r(\mathbf{s}_{i,t}, \mathbf{a}_{i,t}) + \gamma \hat{V}_{\phi}^{\pi}(\mathbf{s}_{i,t+1}) - \hat{V}_{\phi}^{\pi}(\mathbf{s}_{i,t}) \right)$$

+ lower variance (due to critic)

- not unbiased (if the critic is not perfect)

Policy gradient:
$$\nabla_{\theta} J(\theta) \approx \frac{1}{N} \sum_{i=1}^{N} \sum_{t=1}^{T} \nabla_{\theta} \log \pi_{\theta}(\mathbf{a}_{i,t}|\mathbf{s}_{i,t}) \left(\left(\sum_{t'=t}^{T} \gamma^{t'-t} r(\mathbf{s}_{i,t'}, \mathbf{a}_{i,t'}) \right) - b \right)$$

+ no bias

higher variance (because single-sample estimate)

can we use \hat{V}_{ϕ}^{π} and still keep the estimator unbiased?

$$\nabla_{\theta} J(\theta) \approx \frac{1}{N} \sum_{i=1}^{N} \sum_{t=1}^{T} \nabla_{\theta} \log \pi_{\theta}(\mathbf{a}_{i,t} | \mathbf{s}_{i,t}) \left(\left(\sum_{t'=t}^{T} \gamma^{t'-t} r(\mathbf{s}_{i,t'}, \mathbf{a}_{i,t'}) \right) - \hat{V}_{\phi}^{\pi}(\mathbf{s}_{i,t}) \right)$$

+ no bias

+ lower variance (baseline is closer to rewards)

Control variates: action-dependent baselines

$$Q^{\pi}(\mathbf{s}_t, \mathbf{a}_t) = \sum_{t'=t}^{T} E_{\pi_{\theta}} [r(\mathbf{s}_{t'}, \mathbf{a}_{t'}) | \mathbf{s}_t, \mathbf{a}_t]$$

$$V^{\pi}(\mathbf{s}_t) = E_{\mathbf{a}_t \sim \pi_{\theta}(\mathbf{a}_t | \mathbf{s}_t)}[Q^{\pi}(\mathbf{s}_t, \mathbf{a}_t)]$$

$$A^{\pi}(\mathbf{s}_t, \mathbf{a}_t) = Q^{\pi}(\mathbf{s}_t, \mathbf{a}_t) - V^{\pi}(\mathbf{s}_t)$$

$$\hat{A}^{\pi}(\mathbf{s}_t, \mathbf{a}_t) = \sum_{t'=t}^{\infty} \gamma^{t'-t} r(\mathbf{s}_{t'}, \mathbf{a}_{t'}) - V_{\phi}^{\pi}(\mathbf{s}_t)$$

+ no bias

- higher variance (because single-sample estimate)

$$\hat{A}^{\pi}(\mathbf{s}_t, \mathbf{a}_t) = \sum_{t'=t}^{\infty} \gamma^{t'-t} r(\mathbf{s}_{t'}, \mathbf{a}_{t'}) - Q_{\phi}^{\pi}(\mathbf{s}_t, \mathbf{a}_t)$$

+ goes to zero in expectation if critic is correct!

- not correct

$$\nabla_{\theta} J(\theta) \approx \frac{1}{N} \sum_{i=1}^{N} \sum_{t=1}^{T} \nabla_{\theta} \log \pi_{\theta}(\mathbf{a}_{i,t}|\mathbf{s}_{i,t}) \left(\hat{Q}_{i,t} - Q_{\phi}^{\pi}(\mathbf{s}_{i,t}, \mathbf{a}_{i,t}) \right) + \frac{1}{N} \sum_{i=1}^{N} \sum_{t=1}^{T} \nabla_{\theta} E_{\mathbf{a} \sim \pi_{\theta}(\mathbf{a}_{t}|\mathbf{s}_{i,t})} \left[Q_{\phi}^{\pi}(\mathbf{s}_{i,t}, \mathbf{a}_{t}) \right]$$

use a critic without the bias (still unbiased), provided second term can be evaluated

Gu et al. 2016 (Q-Prop)

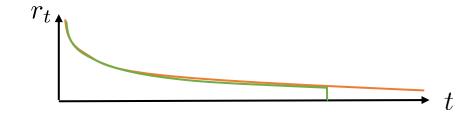

Eligibility traces & n-step returns

$$\hat{A}_{\mathrm{C}}^{\pi}(\mathbf{s}_t, \mathbf{a}_t) = r(\mathbf{s}_t, \mathbf{a}_t) + \gamma \hat{V}_{\phi}^{\pi}(\mathbf{s}_{t+1}) - \hat{V}_{\phi}^{\pi}(\mathbf{s}_t)$$

$$\hat{A}_{\mathrm{MC}}^{\pi}(\mathbf{s}_{t}, \mathbf{a}_{t}) = \sum_{t'=t}^{\infty} \gamma^{t'-t} r(\mathbf{s}_{t'}, \mathbf{a}_{t'}) - \hat{V}_{\phi}^{\pi}(\mathbf{s}_{t})$$

- + lower variance
- higher bias if value is wrong (it always is)
- + no bias
- higher variance (because single-sample estimate)

Can we combine these two, to control bias/variance tradeoff?

cut here before variance gets too big!

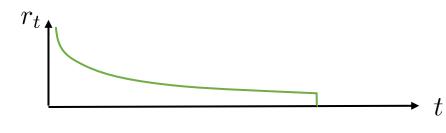

smaller variance

bigger variance

$$\hat{A}_n^{\pi}(\mathbf{s}_t, \mathbf{a}_t) = \sum_{t'=t}^{t+n} \gamma^{t'-t} r(\mathbf{s}_{t'}, \mathbf{a}_{t'}) - \hat{V}_{\phi}^{\pi}(\mathbf{s}_t) + \gamma^n \hat{V}_{\phi}^{\pi}(\mathbf{s}_{t+n})$$

choosing n > 1 often works better!

Generalized advantage estimation

Do we have to choose just one n?

Cut everywhere all at once!

$$\hat{A}_n^{\pi}(\mathbf{s}_t, \mathbf{a}_t) = \sum_{t'=t}^{t+n} \gamma^{t'-t} r(\mathbf{s}_{t'}, \mathbf{a}_{t'}) - \hat{V}_{\phi}^{\pi}(\mathbf{s}_t) + \gamma^n \hat{V}_{\phi}^{\pi}(\mathbf{s}_{t+n})$$

$$\hat{A}_{\mathrm{GAE}}^{\pi}(\mathbf{s}_t, \mathbf{a}_t) = \sum_{n=1}^{\infty} w_n \hat{A}_n^{\pi}(\mathbf{s}_t, \mathbf{a}_t)$$

weighted combination of n-step returns

How to weight?

Mostly prefer cutting earlier (less variance)

$$w_n \propto \lambda^{n-1}$$

 $w_n \propto \lambda^{n-1}$ exponential falloff

$$\hat{A}_{GAE}^{\pi}(\mathbf{s}_{t}, \mathbf{a}_{t}) = r(\mathbf{s}_{t}, \mathbf{a}_{t}) + \gamma((1 - \lambda)\hat{V}_{\phi}^{\pi}(\mathbf{s}_{t+1}) + \lambda(r(\mathbf{s}_{t+1}, \mathbf{a}_{t+1}) + \gamma((1 - \lambda)\hat{V}_{\phi}^{\pi}(\mathbf{s}_{t+2}) + \lambda r(\mathbf{s}_{t+2}, \mathbf{a}_{t+2}) + \dots)$$

$$\hat{A}_{\mathrm{GAE}}^{\pi}(\mathbf{s}_t, \mathbf{a}_t) = \sum_{t'=t}^{\infty} (\gamma \lambda)^{t'-t} \delta_{t'}$$

$$\hat{A}_{GAE}^{\pi}(\mathbf{s}_t, \mathbf{a}_t) = \sum_{t'=t}^{\infty} (\gamma \lambda)^{t'-t} \delta_{t'} \qquad \delta_{t'} = r(\mathbf{s}_{t'}, \mathbf{a}_{t'}) + \gamma \hat{V}_{\phi}^{\pi}(\mathbf{s}_{t'+1}) - \hat{V}_{\phi}^{\pi}(\mathbf{s}_{t'})$$

> similar effect as discount!

option 1:
$$\nabla_{\theta} J(\theta) \approx \frac{1}{N} \sum_{i=1}^{N} \sum_{t=1}^{T} \nabla_{\theta} \log \pi_{\theta}(\mathbf{a}_{i,t} | \mathbf{s}_{i,t}) \left(\sum_{t'=t}^{T} \gamma^{t'-t} r(\mathbf{s}_{i,t'}, \mathbf{a}_{i,t'}) \right)$$

remember this?

discount = variance reduction!

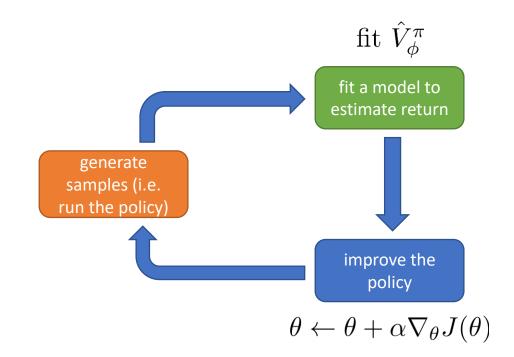

Review, Examples, and Additional Readings

Review

- Actor-critic algorithms:
 - Actor: the policy
 - Critic: value function
 - Reduce variance of policy gradient
- Policy evaluation
 - Fitting value function to policy
- Discount factors
 - Carpe diem Mr. Robot 🐯

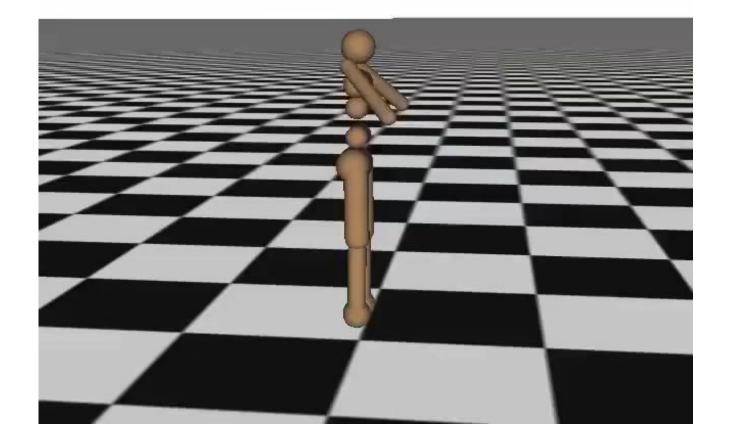

- ...but also a variance reduction trick
- Actor-critic algorithm design
 - One network (with two heads) or two networks
 - Batch-mode, or online (+ parallel)
- State-dependent baselines
 - Another way to use the critic
 - Can combine: n-step returns or GAE

Actor-critic examples

- High dimensional continuous control with generalized advantage estimation (Schulman, Moritz, L., Jordan, Abbeel '16)
- Batch-mode actor-critic
- Blends Monte Carlo and function approximator estimators (GAE)

Iteration 0

Actor-critic examples

- Asynchronous methods for deep reinforcement learning (Mnih, Badia, Mirza, Graves, Lillicrap, Harley, Silver, Kavukcuoglu '16)
- Online actor-critic, parallelized batch
- N-step returns with N = 4
- Single network for actor and critic
